SECURITY TIPS to keep you away from CYBER THREATS

Install antivirus software and scan your computer regularly

Having an antivirus is good to prevent data breaches and it is effective in identifying any malicious files in your device during your regular scanning.

Choose safe passwords

Avoid using passwords that can be derived from your public information such as your name, birthday and contact number.

Do not click on links from unknown users

Refrain from clicking on links from unknown senders to avoid getting tricked by hackers attempting to take over your device.

Turn on VPN

Stay signed into your organisation's VPN can secure your network from hackers to intercept your company sensitive data.

Use a private search engine

A private search engine is a tracking-free platform and is able to prevent hackers from intercepting your searches.

Implement Multi-Factor Authentication (MFA)

Turn on MFA for your system or application login in order to gain access to sensitive data and protected systems.
